

Activated Carbon & Filter Media

Activated carbon filters are particularly effective at removing pollutants which create unpleasant taste, colour, and odour in water. These fast-acting filters can eliminate or reduce the levels of chlorine by-products, pesticides, herbicides, and other organic and industrial chemicals. By using carbon filters the taste of the water is also improved. Sometimes a carbon filter is referred to as a "polishing" filter. To get the most of a carbon filter, it should be kept free of sediment and heavy organic impurities. The filter media needs to be changed periodically depending on the water being filtered.
