

Gas Volume Tester - for Glass & PET Bottles

- This is an easy to use unit for determining the 'Gas Volumes' of a soda /soft drink.
- 'Gas volume' is a unit determined by the pressure inside a bottle and the temperature of the liquid.
- The Gas Volume Tester is basically a quality-checking unit.
- One or two bottles are taken out from the production line at regular intervals.
- The Tester is first clamped on the bottle to be checked.
- Then the bottle is punctured with the spindle by rotating the knob and the pressure noted on the pressure gauge.
- The Tester is then removed, bottle opened and the temperature of liquid checked.
- Both values are noted and the 'gas volumes' found by referring chart provided.
- Soda and various soft drinks have varying 'gas volumes' and the values have to be adhered to get the best quality.
- The Tester is available for both glass & PET bottles.
It is made of SS 304
