

Soda / Soft Drink Filler - for Glass Bottles - PLC Controlled

This machine is used for soda/soft drink filling and crown capping of glass bottles. It can be used for filling 200 ml, 250 ml & 300 ml size glass bottles. It is only a filler / capper and so needs to be connected to a Carbonator. Soda flows from the Carbonator to the machine. A pipe is provided for connecting the Carbonator and the machine. The machine is semi automatic and so once a crown cork and bottle have been placed manually, the filling & crown capping take place automatically when a switch is pressed. The fill quantity can be slightly adjusted with the help of the inlet line ball valve and the snift valve. It is easy to use – the worker places a crown cap and a bottle on the bottle table and presses a switch. The machine fills and crowns the bottle automatically. The filled bottle is removed and the cycle is repeated. The filling and crowning times can be adjusted with the help of the PLC (Computer Controlled).

The machine is pneumatically operated and so requires a 1.5 Hp Air compressor. The output is about 400 bottles / minute. It is built on a rigid stand and all its parts are made for rugged use.

The maintenance is limited to regular oiling, change of washers, V Belt and springs as and when they wear out. Other than the above, it requires very less maintenance. The main advantage of this machine is it is minimally laborious and so ideal for ladies, un skilled workers etc.
